

Our application is an add-event-to-calendar app. This app enables user to search events by major, date and keywords and then add multiple events a time to their calendar.

The dataset of our app comes from Carleton's website. We would write code in Python and use BeautifulSoup to scrape and parse data from website. Then the Python object would be turned into JSON and it would be sent to web server using Flask.

The features of our app include:

- Search events by key words/department/date.
- Arrange events by date/alphabetic order. (Sort by Date, Sort by Alphabetic Order)
- Add multiple events at a time to desktop calendar/Google calendar.
- User can rate events by star.
